

# Chapter 7: Triangles

## 7.1 Angles and triangles pg. 188-193

**A vertex and two rays form an Angle**

**Symbol  $\sphericalangle$  or  $<$**

**Naming an Angle**

- The letter that represents the vertex is written in the middle.

$\sphericalangle AOB$  or  $\sphericalangle BOA$

*Vertex*

$\sphericalangle DEF$  or  $\sphericalangle FED$

**Types of Angles**

<b>Acute</b>	<b>Less than <math>90^\circ</math></b>	
<b>Right</b>	<b>= <math>90^\circ</math></b>	
<b>Obtuse</b>	<b>Between <math>90^\circ</math> and <math>180^\circ</math></b>	
<b>Straight</b>	<b>= <math>180^\circ</math></b>	

**Reflex**      **Greater than  $180^\circ$**

Two angles are complementary  
when the sum of their angles is  $90^\circ$

$$\angle BAC + \angle CAD = 90^\circ$$

Two angles are supplementary  
when the sum of their angles is  $180^\circ$

Straight angle =  $180^\circ$

$$\angle BAC + \angle DAC = 180^\circ$$

**Sum of Angles around a vertex is 360°.**

**Adjacent angles: 2 angles side by side that share a vertex and common side.**

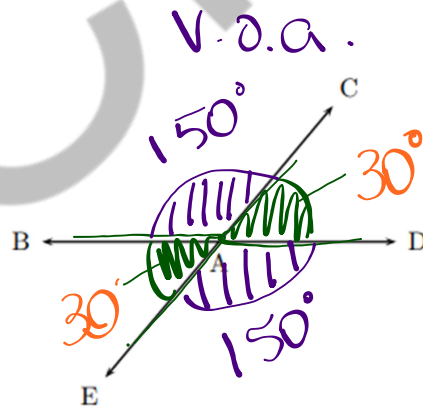

Angles A + B are adjacent

**Congruent: 2 angles with the same measure**

Symbol  $\cong$   $\sim$  equal

**Vertically Opposite Angles: are congruent**

The sum of the interior angles of a triangle

is: 180°.

$$a + b + c = 180$$

The sum of the interior angles of a quadrilateral is

360.

Types of Triangles

scalene

equilateral

3 equal sides and angles

isosceles  
isofco

2 equal sides and angles

The sum of angles and 2 is 90.

Right angled

**Parallel lines theorem**

**When a transversal cuts across two parallel lines, various combinations of congruent angles are created.**

**The alternate interior angles are congruent.**

$$\angle 3 \cong \angle 6$$

$$\angle 4 \cong \angle 5$$

**The alternate exterior angles are congruent.**

$$\angle 2 \cong \angle 7$$

$$\angle 1 \cong \angle 8$$

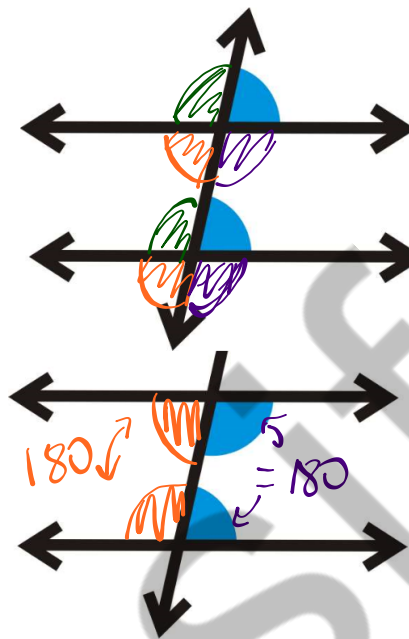

**The corresponding angles are congruent.**

$$\begin{aligned} \angle 1 &\cong \angle 5 \\ \angle 2 &\cong \angle 6 \\ \angle 3 &\cong \angle 7 \\ \angle 4 &\cong \angle 8 \end{aligned}$$

<sup>same side</sup>  
**The interior angles are supplementary.**

$$\begin{aligned} \angle 4 + \angle 6 &= 180^\circ \\ \angle 3 + \angle 5 &= 180^\circ \end{aligned}$$

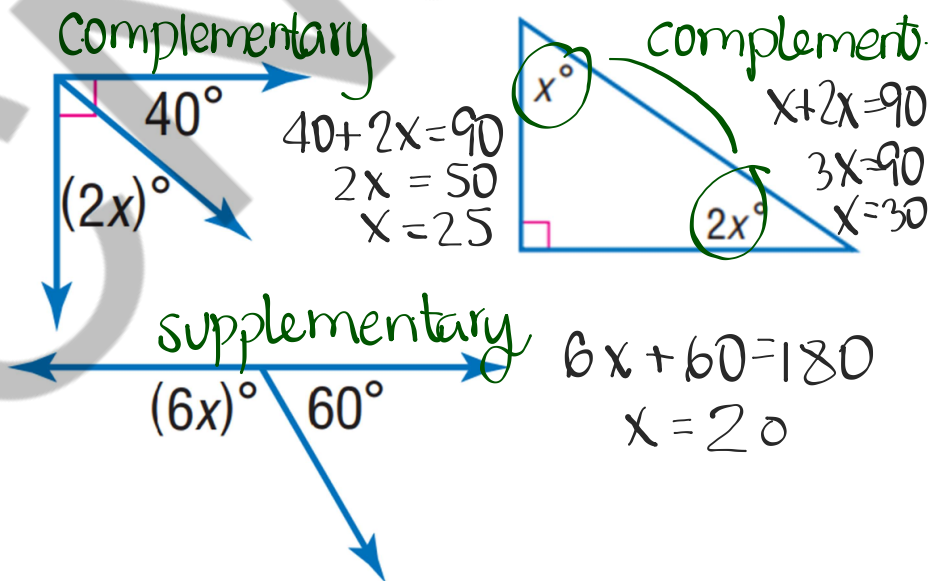

**Homework page 188 activity 1**

**Find all angles**

**Find the value of x.**

V.O.A.  $\cong$

$(x+16)^\circ$   $(4x-5)^\circ$

$$x+16=4x-5$$

$$21=3x$$

$$x=7$$

corresponding  $\cong$

$100^\circ$

$(x-10)^\circ$

$100 = x - 10$

$x = 110$

Example: Find the value of  $x$ .

parallel

$\overline{MN} \parallel \overline{RS}$

Statement	Justification
$\angle FGH = 63^\circ$	corresponding to $\angle GHE$
$\angle FQG = 55^\circ$	alt. exterior angle to $\angle HES$
$\angle GFG = 62^\circ$	$\Delta = 180^\circ$

**Magic triangle ( $30^\circ - 60^\circ - 90^\circ$  triangle)**

The side opposite  $30^\circ$   
is half the  
hypotenuse.

Find the length of the  
hypotenuse.
